Statistics

Some terminology

Some terminology

- **Population**: *All* relevant data.

Some terminology

- **Population**: *All* relevant data.
- **Sample**: *Some* of the relevant data, hopefully enough to be *representative* of the population.

Some terminology

- **Population**: *All* relevant data.
- **Sample**: *Some* of the relevant data, hopefully enough to be *representative* of the population.
  - This should be a **random sample** with no **bias** towards a group or individual in the population.

Some terminology

- **Population**: *All* relevant data.
- **Sample**: *Some* of the relevant data, hopefully enough to be *representative* of the population.
  - This should be a **random sample** with no **bias** towards a group or individual in the population.
  - This can be difficult to achieve and careful thought needs to be given as to how data is collected.

Some terminology

- **Population**: *All* relevant data.
- **Sample**: *Some* of the relevant data, hopefully enough to be *representative* of the population.
  - This should be a **random sample** with no **bias** towards a group or individual in the population.
  - This can be difficult to achieve and careful thought needs to be given as to how data is collected.
- Sample/population **data** can be:
  - **Discrete**: E.g., number of attacks on a port in a given hour of the day.

Some terminology

- **Population**: *All* relevant data.
- **Sample**: *Some* of the relevant data, hopefully enough to be *representative* of the population.
  - This should be a **random sample** with no **bias** towards a group or individual in the population.
  - This can be difficult to achieve and careful thought needs to be given as to how data is collected.
- Sample/population **data** can be:
  - **Discrete**: E.g., number of attacks on a port in a given hour of the day. Usually integer-valued, e.g., 0, 1, 2, etc.

Some terminology

- **Population**: *All* relevant data.
- **Sample**: *Some* of the relevant data, hopefully enough to be *representative* of the population.
  - This should be a **random sample** with no **bias** towards a group or individual in the population.
  - This can be difficult to achieve and careful thought needs to be given as to how data is collected.
- Sample/population **data** can be:
  - **Discrete**: E.g., number of attacks on a port in a given hour of the day. Usually integer-valued, e.g., 0, 1, 2, etc.
  - **Continuous**: E.g., amount of time elapsed since previous attack.

Some terminology

- **Population**: *All* relevant data.
- **Sample**: *Some* of the relevant data, hopefully enough to be *representative* of the population.
  - This should be a **random sample** with no **bias** towards a group or individual in the population.
  - This can be difficult to achieve and careful thought needs to be given as to how data is collected.
- Sample/population **data** can be:
  - **Discrete**: E.g., number of attacks on a port in a given hour of the day. Usually integer-valued, e.g., 0, 1, 2, etc.
  - **Continuous**: E.g., amount of time elapsed since previous attack. Often classified into groups, e.g., $0-5$ minutes, $5-10$ minutes, $10-15$ minutes, etc.

Grouping Data

- Suppose that we have data from a random sample of 100 people, giving their age at their last birthday.

Grouping Data

- Suppose that we have data from a random sample of 100 people, giving their age at their last birthday.

66	70	10	54	62	13	11	15	69	26	49	11	3
67	10	54	42	32	56	39	60	79	33	12	47	24
19	47	63	32	7	70	55	46	11	20	15	39	37
28	72	46	64	61	51	56	53	61	11	80	53	28
76	6	5	39	58	29	52	54	47	60	62	51	72
41	57	32	12	33	17	40	20	10	27	47	71	68
44	7	23	17	81	23	12	33	16	46	71	48	58
79	80	43	31	72	68	36	41	11				

- It's a little hard to get a feel for the data, so we could count the frequency in each bin, order the data numerically, or calculate various **statistics**.

Grouping Data

- Suppose that we have data from a random sample of 100 people, giving their age at their last birthday.

66	70	10	54	62	13	11	15	69	26	49	11	3
67	10	54	42	32	56	39	60	79	33	12	47	24
19	47	63	32	7	70	55	46	11	20	15	39	37
28	72	46	64	61	51	56	53	61	11	80	53	28
76	6	5	39	58	29	52	54	47	60	62	51	72
41	57	32	12	33	17	40	20	10	27	47	71	68
44	7	23	17	81	23	12	33	16	46	71	48	58
79	80	43	31	72	68	36	41	11				

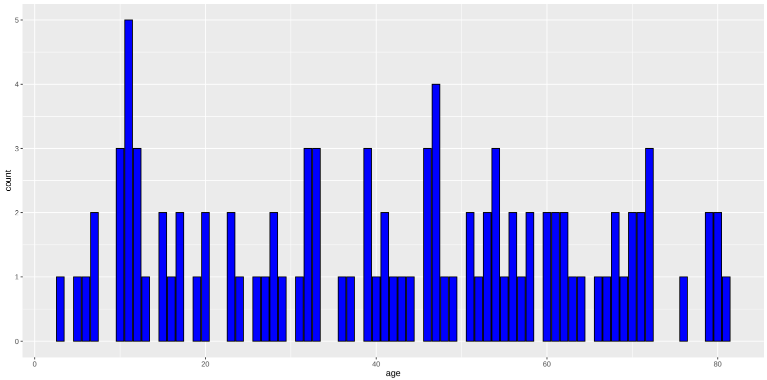
- It's a little hard to get a feel for the data, so we could count the frequency in each bin, order the data numerically, or calculate various **statistics**.
- In doing so, we lose some of the information but might get a clearer overview.

Grouping Data

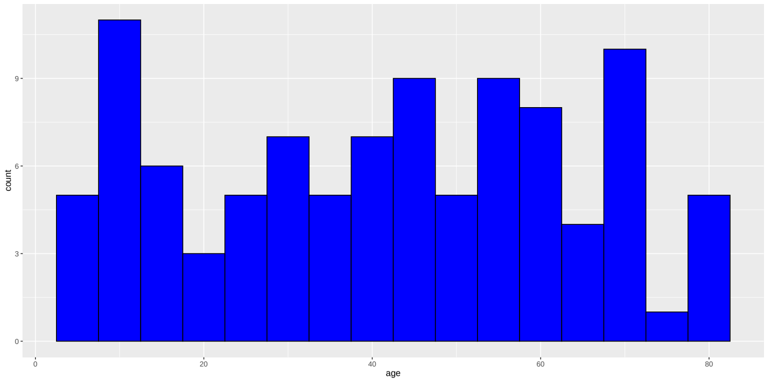
- Here we have placed the data into bins of **class width** 5.

Group Number	Age Range	Tally	Number in Group (Frequency)
1	$0 \leq x < 5$		1
2	$5 \leq x < 10$		4
3	$10 \leq x < 15$		12
4	$15 \leq x < 20$		6
5	$20 \leq x < 25$		5
6	$25 \leq x < 30$		5
7	$30 \leq x < 35$		7
8	$35 \leq x < 40$		5
9	$40 \leq x < 45$		6
10	$45 \leq x < 50$		9
11	$50 \leq x < 55$		8
12	$55 \leq x < 60$		6
13	$60 \leq x < 65$		8
14	$65 \leq x < 70$		5
15	$70 \leq x < 75$		7
16	$75 \leq x < 80$		3
17	$80 \leq x < 85$		3
18	$85 \leq x < 90$		0
19	$90 \leq x < 95$		0
20	$95 \leq x < 100$		0
21	$100 \leq x < 105$		0

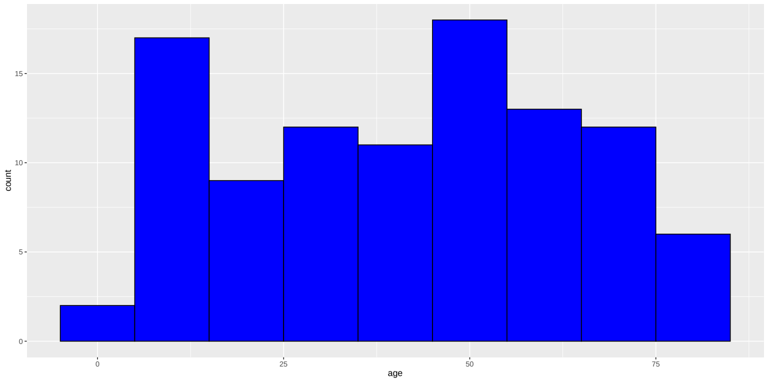
Charts: Bar Chart



Charts: Histogram



Charts: Histogram



Measures of Central Tendency

Measures of Central Tendency

- **Arithmetic Mean**: Add up all of the values and divide by how many there are.

Measures of Central Tendency

- **Arithmetic Mean**: Add up all of the values and divide by how many there are.
- **Median**: Order the data and look at the middle value(s).

Measures of Central Tendency

- **Arithmetic Mean**: Add up all of the values and divide by how many there are.
- **Median**: Order the data and look at the middle value(s).
- **Mode**: Tally the data and select the one with the highest frequency.

(Arithmetic) Mean

(Arithmetic) Mean

- In a sample of five values (6, 9, 2, 4, 3) the mean value is:

$$\frac{6+9+2+4+3}{5} = \frac{24}{5} = 4.8.$$

(Arithmetic) Mean

- In a sample of five values (6, 9, 2, 4, 3) the mean value is:

$$\frac{6+9+2+4+3}{5} = \frac{24}{5} = 4.8.$$

- The one hundred values from the previous histogram example add up to 4165 and so the mean value is $\frac{4165}{100} = 41.65$.

(Arithmetic) Mean

- In a sample of five values (6, 9, 2, 4, 3) the mean value is:

$$\frac{6+9+2+4+3}{5} = \frac{24}{5} = 4.8.$$

- The one hundred values from the previous histogram example add up to 4165 and so the mean value is $\frac{4165}{100} = 41.65$.
- For n data values $x_1, x_2, \ldots, x_n$, the formula for the mean is:

$$\bar{x} = \frac{x_1 + x_2 + \ldots + x_n}{n}.$$

(Arithmetic) Mean

- In a sample of five values (6, 9, 2, 4, 3) the mean value is:

$$\frac{6+9+2+4+3}{5} = \frac{24}{5} = 4.8.$$

- The one hundred values from the previous histogram example add up to 4165 and so the mean value is $\frac{4165}{100} = 41.65$.
- For n data values $x_1, x_2, \ldots, x_n$, the formula for the mean is:

$$\bar{x} = \frac{x_1 + x_2 + \ldots + x_n}{n}.$$

Median

Median

- Here we arrange the data values in ascending (or descending) order. Then the **median** is:
  1. the middle item if there is an odd number of data items;
  2. the average of the middle two items if there is an even number of data items.

Median

- Here we arrange the data values in ascending (or descending) order. Then the **median** is:
  1. the middle item if there is an odd number of data items;
  2. the average of the middle two items if there is an even number of data items.
- E.g., if the ordered data is 2, 3, 4, 6, 9, then the middle item is 4 and so the median is 4.

Median

- Here we arrange the data values in ascending (or descending) order. Then the **median** is:
  1. the middle item if there is an odd number of data items;
  2. the average of the middle two items if there is an even number of data items.
- E.g., if the ordered data is 2, 3, 4, 6, 9, then the middle item is 4 and so the median is 4.
- From our histogram example, the sample of one hundred data values, the ordered data is:

3	5	6	7	7	10	10	10	11	11	11	11	11
12	12	12	13	15	15	16	17	17	19	20	20	23
23	24	26	27	28	28	29	31	32	32	32	33	33
33	36	37	39	39	39	40	41	41	42	**43**	**44**	46
46	46	47	47	47	47	48	49	51	51	52	53	53
54	54	54	55	56	56	57	58	58	60	60	61	61
62	62	63	64	66	67	68	68	69	70	70	71	71
72	72	72	76	79	79	80	80	81				

Median

- Here we arrange the data values in ascending (or descending) order. Then the **median** is:
  1. the middle item if there is an odd number of data items;
  2. the average of the middle two items if there is an even number of data items.
- E.g., if the ordered data is 2, 3, 4, 6, 9, then the middle item is 4 and so the median is 4.
- From our histogram example, the sample of one hundred data values, the ordered data is:

3	5	6	7	7	10	10	10	11	11	11	11	11
12	12	12	13	15	15	16	17	17	19	20	20	23
23	24	26	27	28	28	29	31	32	32	32	33	33
33	36	37	39	39	39	40	41	41	42	**43**	**44**	46
46	46	47	47	47	47	48	49	51	51	52	53	53
54	54	54	55	56	56	57	58	58	60	60	61	61
62	62	63	64	66	67	68	68	69	70	70	71	71
72	72	72	76	79	79	80	80	81				

- The middle two values are 43 and 44, hence the median is 43.5.

Mode

Mode

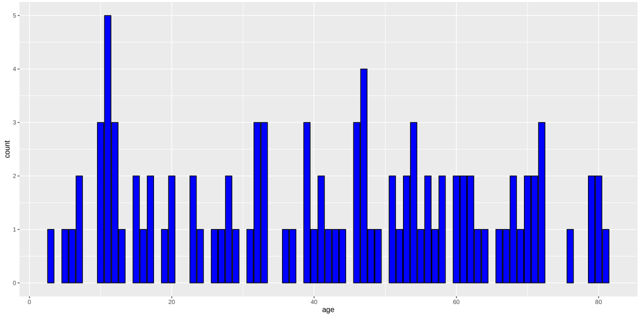
- The **mode** is the data value which occurs most in the sample.

Mode

- The **mode** is the data value which occurs most in the sample.
- For grouped data we can talk of a **modal group** or **modal class**, sometimes specifying the mid-point in order to give a single value.

Mode

- The **mode** is the data value which occurs most in the sample.
- For grouped data we can talk of a **modal group** or **modal class**, sometimes specifying the mid-point in order to give a single value.
- For the one hundred data values in the histogram example the mode is clearly indicated on the bar chart as the tallest bar: 11. We can also tally values to find it.



Probability

Definition of Probability

Definition of Probability

- A is a statement which is either true or false.

Definition of Probability

- A is a statement which is either true or false.
- N is the number of trials, or observations.

Definition of Probability

- A is a statement which is either true or false.
- N is the number of trials, or observations.
- S is the number of successes (so $N - S$ is the number of failures).

Definition of Probability

- A is a statement which is either true or false.
- N is the number of trials, or observations.
- S is the number of successes (so $N - S$ is the number of failures).
- For a single trial: Probability that A is true, or the **probability of success**, is:

$$P(A) = \frac{S}{N}.$$

Definition of Probability

- A is a statement which is either true or false.
- N is the number of trials, or observations.
- S is the number of successes (so $N - S$ is the number of failures).
- For a single trial: Probability that A is true, or the **probability of success**, is:

$$P(A) = \frac{S}{N}.$$

- Since $0 \leq S \leq N$, then $0 \leq P(A) \leq 1$.

Definition of Probability

- A is a statement which is either true or false.
- N is the number of trials, or observations.
- S is the number of successes (so $N - S$ is the number of failures).
- For a single trial: Probability that A is true, or the **probability of success**, is:

$$P(A) = \frac{S}{N}.$$

- Since $0 \leq S \leq N$, then $0 \leq P(A) \leq 1$.
- The *probability of failure* is:

$$P(\overline{A}) = \frac{N - S}{N} = 1 - \frac{S}{N} = 1 - P(A).$$

Probability: Example 1

Tossing a coin:

Probability: Example 1

Tossing a coin:

- Toss a coin 4 times: we *expect* 2 heads.

Probability: Example 1

Tossing a coin:

- Toss a coin 4 times: we *expect* 2 heads.
- Toss a coin 100 times: we *expect* 50 heads.

Probability: Example 1

Tossing a coin:

- Toss a coin 4 times: we *expect* 2 heads.
- Toss a coin 100 times: we *expect* 50 heads.
- Toss a coin once: what do we *expect*?

Probability: Example 1

Tossing a coin:

- Toss a coin 4 times: we *expect* 2 heads.
- Toss a coin 100 times: we *expect* 50 heads.
- Toss a coin once: what do we *expect*?

$$P(\text{one head in one trial}) = \frac{1}{2}.$$

Probability: Example 1

Tossing a coin:

- Toss a coin 4 times: we *expect* 2 heads.
- Toss a coin 100 times: we *expect* 50 heads.
- Toss a coin once: what do we *expect*?

$$P(\text{one head in one trial}) = \frac{1}{2}.$$

- $A =$ 'a head shows when a coin is tossed', so $P(A) = \frac{1}{2}$.

Probability: Example

Group Number	Age Range	Tally	Number in Group (Frequency)
1	$0 \leq x < 5$		1
2	$5 \leq x < 10$		4

20	$95 \leq x < 100$		0
21	$100 \leq x < 105$		0

Age at last birthday:

- Probability that one of the people selected at random is in the 15-19 age group.

Probability: Example

Group Number	Age Range	Tally	Number in Group (Frequency)
1	$0 \le x < 5$		1
2	$5 \le x < 10$		4
3	$10 \le x < 15$		12
4	$15 \le x < 20$		6
5	$20 \le x < 25$		5
6	$25 \le x < 30$		5
7	$30 \le x < 35$		7
8	$35 \le x < 40$		5
9	$40 \le x < 45$		6
10	$45 \le x < 50$		9
11	$50 \le x < 55$		8
12	$55 \le x < 60$		6
13	$60 \le x < 65$		8
14	$65 \le x < 70$		5
15	$70 \le x < 75$		7
16	$75 \le x < 80$		3
17	$80 \le x < 85$		3
18	$85 \le x < 90$		0
19	$90 \le x < 95$		0
20	$95 \le x < 100$		0
21	$100 \le x < 105$		0

Age at last birthday:

- Probability that one of the people selected at random is in the 15-19 age group.
- The total number of outcomes is 100 and the number of 'successes' is 6.

Probability: Example

Group Number	Age Range	Tally	Number in Group (Frequency)
1	$0 \leq x < 5$		1
2	$5 \leq x < 10$		4
3	$10 \leq x < 15$		12
4	$15 \leq x < 20$		6
5	$20 \leq x < 25$		5
6	$25 \leq x < 30$		5

16	$75 \leq x < 80$		3
17	$80 \leq x < 85$		3
18	$85 \leq x < 90$		0
19	$90 \leq x < 95$		0
20	$95 \leq x < 100$		0
21	$100 \leq x < 105$		0

Age at last birthday:

- Probability that one of the people selected at random is in the 15-19 age group.
- The total number of outcomes is 100 and the number of 'successes' is 6.
- The probability of success is: $P(\text{Success}) = \frac{6}{100}$.
- The probability of failure is: $P(\text{Failure}) = \frac{94}{100}$.

Probability: Example 3

Rolling dice:

Probability: Example 3

Rolling dice:

- Two dice are rolled and the sum of the spots is calculated.

Probability: Example 3

Rolling dice:

- Two dice are rolled and the sum of the spots is calculated.
- $A =$ 'The sum is 7 when two dice are rolled.'

Probability: Example 3

Rolling dice:

- Two dice are rolled and the sum of the spots is calculated.
- $A =$ 'The sum is 7 when two dice are rolled.'

(1, 1)	(1, 2)	(1, 3)	(1, 4)	(1, 5)	**(1, 6)**
(2, 1)	(2, 2)	(2, 3)	(2, 4)	**(2, 5)**	(2, 6)
(3, 1)	(3, 2)	(3, 3)	**(3, 4)**	(3, 5)	(3, 6)
(4, 1)	(4, 2)	**(4, 3)**	(4, 4)	(4, 5)	(4, 6)
(5, 1)	**(5, 2)**	(5, 3)	(5, 4)	(5, 5)	(5, 6)
(6, 1)	(6, 2)	(6, 3)	(6, 4)	(6, 5)	(6, 6)

Probability: Example 3

Rolling dice:

- Two dice are rolled and the sum of the spots is calculated.
- A = 'The sum is 7 when two dice are rolled.'

(1, 1)	(1, 2)	(1, 3)	(1, 4)	(1, 5)	**(1, 6)**
(2, 1)	(2, 2)	(2, 3)	(2, 4)	**(2, 5)**	(2, 6)
(3, 1)	(3, 2)	(3, 3)	**(3, 4)**	(3, 5)	(3, 6)
(4, 1)	(4, 2)	**(4, 3)**	(4, 4)	(4, 5)	(4, 6)
(5, 1)	**(5, 2)**	(5, 3)	(5, 4)	(5, 5)	(5, 6)
(6, 1)	(6, 2)	(6, 3)	(6, 4)	(6, 5)	(6, 6)

- There are 36 possible outcomes when rolling two dice. But only six of these outcomes make A true.

Probability: Example 3

Rolling dice:

- Two dice are rolled and the sum of the spots is calculated.
- A = 'The sum is 7 when two dice are rolled.'

(1, 1)	(1, 2)	(1, 3)	(1, 4)	(1, 5)	**(1, 6)**
(2, 1)	(2, 2)	(2, 3)	(2, 4)	**(2, 5)**	(2, 6)
(3, 1)	(3, 2)	(3, 3)	**(3, 4)**	(3, 5)	(3, 6)
(4, 1)	(4, 2)	**(4, 3)**	(4, 4)	(4, 5)	(4, 6)
(5, 1)	**(5, 2)**	(5, 3)	(5, 4)	(5, 5)	(5, 6)
(6, 1)	(6, 2)	(6, 3)	(6, 4)	(6, 5)	(6, 6)

- There are 36 possible outcomes when rolling two dice. But only six of these outcomes make A true.
- Number of trials $N = 36$, number of successes $S = 6$.

$$P(A) = \frac{6}{36} = \frac{1}{6}.$$

And, Or: Intersection, Union

- Last semester you used $A \cdot B$ to mean A `AND` B. We will sometimes use $A \wedge B$ instead.

And, Or: Intersection, Union

- Last semester you used $A \cdot B$ to mean A `AND` B. We will sometimes use $A \wedge B$ instead.
- Its analogue in set theory is **intersection**: $A \cap B$.

And, Or: Intersection, Union

- Last semester you used $A \cdot B$ to mean A `AND` B. We will sometimes use $A \wedge B$ instead.
- Its analogue in set theory is **intersection**: $A \cap B$.
- Last semester you used $A + B$ to mean A `OR` B. We will sometimes use $A \vee B$ instead.

And, Or: Intersection, Union

- Last semester you used $A \cdot B$ to mean A `AND` B. We will sometimes use $A \wedge B$ instead.
- Its analogue in set theory is **intersection**: $A \cap B$.
- Last semester you used $A + B$ to mean A `OR` B. We will sometimes use $A \vee B$ instead.
- Its analogue in set theory is **union**: $A \cup B$.

Law of multiplication

Law of multiplication

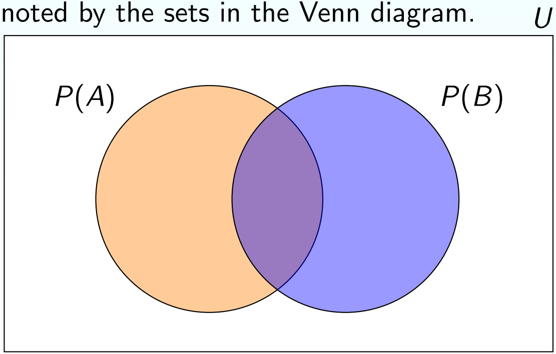
- Consider two events A and B.

Law of multiplication

- Consider two events A and B.
- $P(A)$ and $P(B)$ are denoted by the sets in the Venn diagram.

Law of multiplication

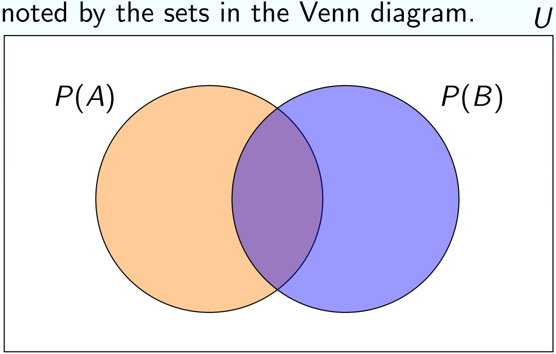
- Consider two events A and B.
- $P(A)$ and $P(B)$ are denoted by the sets in the Venn diagram.



- The intersection of the sets is $P(A \wedge B)$: this is the probability A and B are both true.

Law of multiplication

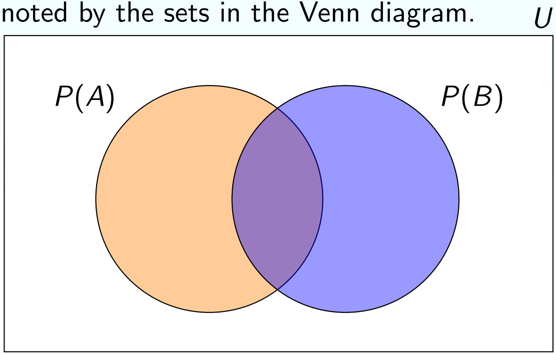
- Consider two events A and B.
- $P(A)$ and $P(B)$ are denoted by the sets in the Venn diagram.



- The intersection of the sets is $P(A \wedge B)$: this is the probability A and B are both true.
- If A and B are mutually exclusive (i.e., can't both be true at the same time), then $P(A \wedge B) = 0$.

Law of multiplication

- Consider two events A and B.
- $P(A)$ and $P(B)$ are denoted by the sets in the Venn diagram.



- The intersection of the sets is $P(A \wedge B)$: this is the probability A and B are both true.
- If A and B are mutually exclusive (i.e., can't both be true at the same time), then $P(A \wedge B) = 0$.
- If A and B are **independent** (i.e., the outcome of one does not affect the other), then $P(A \wedge B) = P(A) \times P(B)$.

Probability: Example 4

Probability: Example 4

- A pack of 52 playing cards has 26 red cards and 26 black cards.

Probability: Example 4

- A pack of 52 playing cards has 26 red cards and 26 black cards.
- One card is drawn from the full pack at random, then replaced in the pack.

Probability: Example 4

- A pack of 52 playing cards has 26 red cards and 26 black cards.
- One card is drawn from the full pack at random, then replaced in the pack.
- Then a second card is drawn from the pack.

Probability: Example 4

- A pack of 52 playing cards has 26 red cards and 26 black cards.
- One card is drawn from the full pack at random, then replaced in the pack.
- Then a second card is drawn from the pack.
- Calculate the probability that both cards are red.

Probability: Example 4

- A pack of 52 playing cards has 26 red cards and 26 black cards.
- One card is drawn from the full pack at random, then replaced in the pack.
- Then a second card is drawn from the pack.
- Calculate the probability that both cards are red.
- Let $A =$ 'The first card is red' and $B =$ 'The second card is red'.

Probability: Example 4

- A pack of 52 playing cards has 26 red cards and 26 black cards.
- One card is drawn from the full pack at random, then replaced in the pack.
- Then a second card is drawn from the pack.
- Calculate the probability that both cards are red.
- Let $A =$ 'The first card is red' and $B =$ 'The second card is red'.
- $P(A) = \frac{26}{52} = \frac{1}{2}$ and $P(B) = \frac{26}{52} = \frac{1}{2}$. The two events are independent, so:

$$P(A \wedge B) = P(A) \times P(B) = \frac{1}{2} \times \frac{1}{2} = \frac{1}{4}.$$

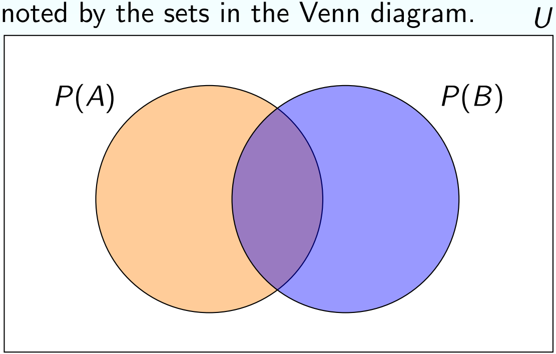
Law of Addition

Law of Addition

- Consider two events A and B.

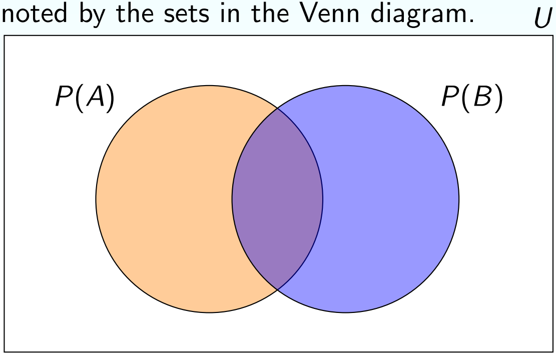
Law of Addition

- Consider two events A and B.
- $P(A)$ and $P(B)$ are denoted by the sets in the Venn diagram.



Law of Addition

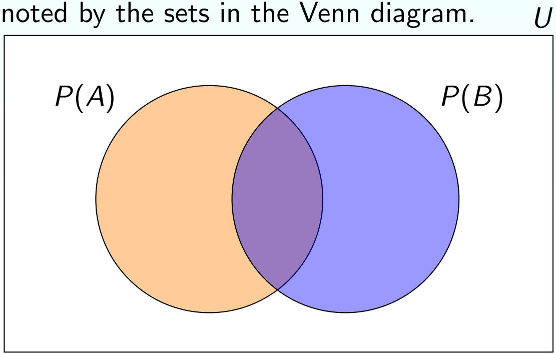
- Consider two events A and B.
- $P(A)$ and $P(B)$ are denoted by the sets in the Venn diagram.



- The union of the sets is $P(A \vee B)$: this is the probability that A or B are true.

Law of Addition

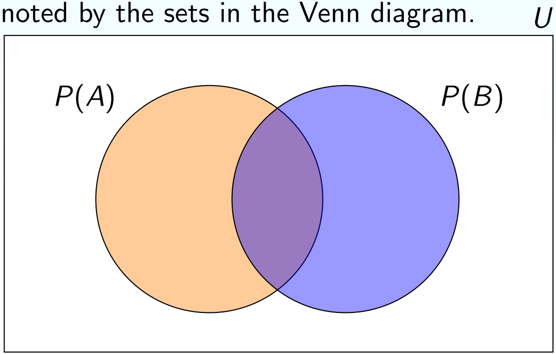
- Consider two events A and B.
- $P(A)$ and $P(B)$ are denoted by the sets in the Venn diagram.



- The union of the sets is $P(A \vee B)$: this is the probability that A or B are true.
- If A and B are mutually exclusive, then $P(A \vee B) = P(A) + P(B)$.

Law of Addition

- Consider two events A and B.
- $P(A)$ and $P(B)$ are denoted by the sets in the Venn diagram.

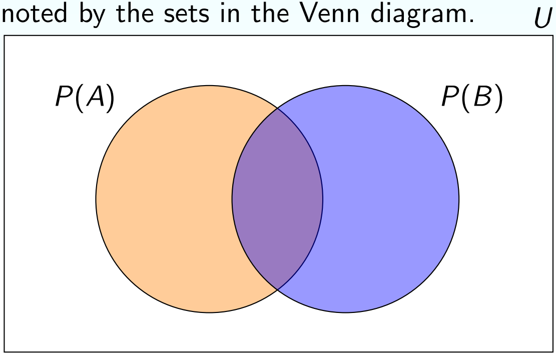


- The union of the sets is $P(A \vee B)$: this is the probability that A or B are true.
- If A and B are mutually exclusive, then $P(A \vee B) = P(A) + P(B)$.
- In general,

$$P(A \vee B) = P(A) + P(B)$$

Law of Addition

- Consider two events A and B.
- $P(A)$ and $P(B)$ are denoted by the sets in the Venn diagram.



- The union of the sets is $P(A \vee B)$: this is the probability that A or B are true.
- If A and B are mutually exclusive, then $P(A \vee B) = P(A) + P(B)$.
- In general,

$$P(A \vee B) = P(A) + P(B) - P(A \wedge B).$$

Probability: Example 4 continued

Probability: Example 4 continued

- Same setup as our previous example, but now we want the probability that at least one card is red. ($P(A) = P(B) = \frac{1}{2}$)

Probability: Example 4 continued

- Same setup as our previous example, but now we want the probability that at least one card is red. ($P(A) = P(B) = \frac{1}{2}$)
- We want to find $P(A \vee B) = P(A) + P(B) - P(A \wedge B)$. Since A and B are independent, then $P(A \wedge B) = P(A) \times P(B)$.

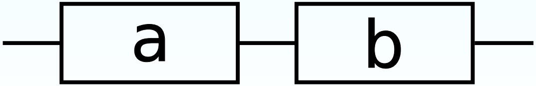
Probability: Example 4 continued

- Same setup as our previous example, but now we want the probability that at least one card is red. ($P(A) = P(B) = \frac{1}{2}$)
- We want to find $P(A \vee B) = P(A) + P(B) - P(A \wedge B)$. Since A and B are independent, then $P(A \wedge B) = P(A) \times P(B)$. So:

$$P(A) + P(B) - P(A) \times P(B) = \frac{1}{2} + \frac{1}{2} - \frac{1}{2} \times \frac{1}{2} = \frac{3}{4}.$$

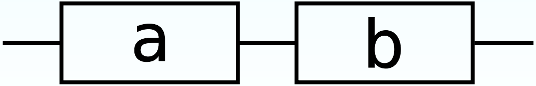
Example: Network 1

- A short network link consists of two sections (a) and (b), in series as shown below.



Example: Network 1

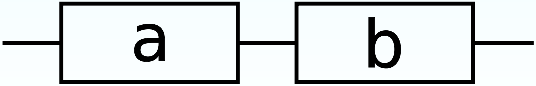
- A short network link consists of two sections (a) and (b), in series as shown below.



- The link functions only if both (a) and (b) both function.

Example: Network 1

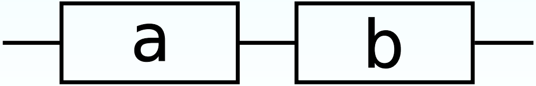
- A short network link consists of two sections (a) and (b), in series as shown below.



- The link functions only if both (a) and (b) both function.
- The two sections are independent. If one fails, the other is not affected.

Example: Network 1

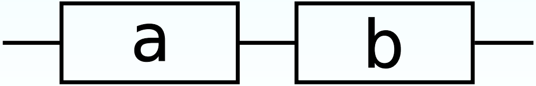
- A short network link consists of two sections (a) and (b), in series as shown below.



- The link functions only if both (a) and (b) both function.
- The two sections are independent. If one fails, the other is not affected.
- The probability that (a) functions is $P(A) = 0.8$, while for (b) the probability is $P(B) = 0.9$.

Example: Network 1

- A short network link consists of two sections (a) and (b), in series as shown below.

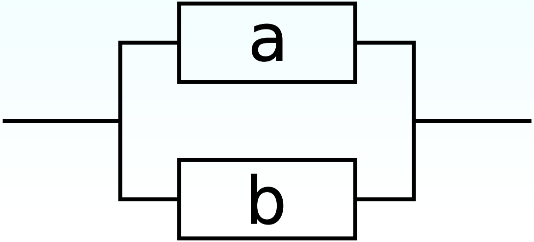


- The link functions only if both (a) and (b) both function.
- The two sections are independent. If one fails, the other is not affected.
- The probability that (a) functions is $P(A) = 0.8$, while for (b) the probability is $P(B) = 0.9$.
- The probability that the network functions (both sections function) is:

$$P(A \wedge B) = P(A) \times P(B) = 0.8 \times 0.9 = 0.72.$$

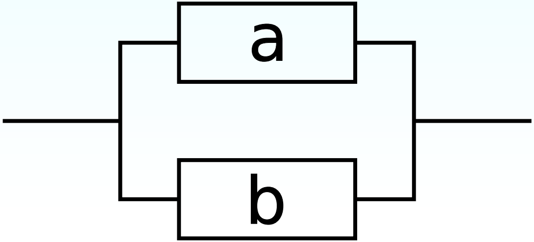
Example: Network 2

- A short network link consists of two sections (a) and (b), in parallel as shown below.



Example: Network 2

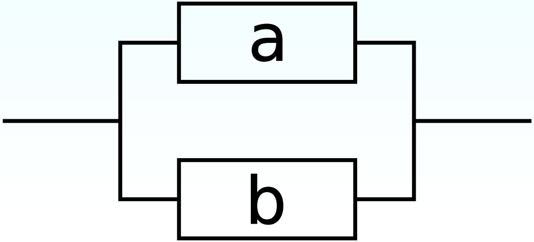
- A short network link consists of two sections (a) and (b), in parallel as shown below.



- The link functions if either of (a) or (b) function (or both).

Example: Network 2

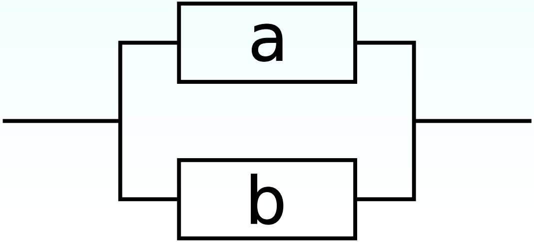
- A short network link consists of two sections (a) and (b), in parallel as shown below.



- The link functions if either of (a) or (b) function (or both).
- The two sections are independent. If one fails, the other is not affected.

Example: Network 2

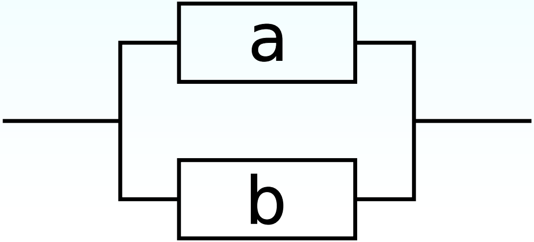
- A short network link consists of two sections (a) and (b), in parallel as shown below.



- The link functions if either of (a) or (b) function (or both).
- The two sections are independent. If one fails, the other is not affected.
- The probability that (a) functions is $P(A) = 0.8$, while for (b) the probability is $P(B) = 0.9$.

Example: Network 2

- A short network link consists of two sections (a) and (b), in parallel as shown below.



- The link functions if either of (a) or (b) function (or both).
- The two sections are independent. If one fails, the other is not affected.
- The probability that (a) functions is $P(A) = 0.8$, while for (b) the probability is $P(B) = 0.9$.
- The probability that the network functions is:

$$P(A \vee B) = P(A) + P(B) - P(A \wedge B) = 0.8 + 0.9 - 0.72 = 0.98.$$

Conditional Probability

- When two events are *not independent*, then the process is not as simple.

Conditional Probability

- When two events are *not independent*, then the process is not as simple.
- Consider a single trial consisting of two events A and B.

Conditional Probability

- When two events are *not independent*, then the process is not as simple.
- Consider a single trial consisting of two events A and B.
- The **conditional probability** $P(B|A)$ means 'the probability that B will be true *given that* A is already true'.

Probability: Example 5

- A pack of 52 playing cards has 26 red cards and 26 black cards.

Probability: Example 5

- A pack of 52 playing cards has 26 red cards and 26 black cards.
- One card is drawn from the full pack at random, then *kept*.

Probability: Example 5

- A pack of 52 playing cards has 26 red cards and 26 black cards.
- One card is drawn from the full pack at random, then *kept*.
- Then a second card is drawn from the pack.

Probability: Example 5

- A pack of 52 playing cards has 26 red cards and 26 black cards.
- One card is drawn from the full pack at random, then *kept*.
- Then a second card is drawn from the pack.
- Calculate the probability that both cards are red.

Probability: Example 5

- A pack of 52 playing cards has 26 red cards and 26 black cards.
- One card is drawn from the full pack at random, then *kept*.
- Then a second card is drawn from the pack.
- Calculate the probability that both cards are red.
- Let $A =$ 'The first card is red' and $B =$ 'The second card is red'.

Probability: Example 5

- A pack of 52 playing cards has 26 red cards and 26 black cards.
- One card is drawn from the full pack at random, then *kept*.
- Then a second card is drawn from the pack.
- Calculate the probability that both cards are red.
- Let $A =$ 'The first card is red' and $B =$ 'The second card is red'.
- $P(A) = \frac{26}{52} = \frac{1}{2}$ as before but $P(B)$ is a conditional probability because it depends on the result of event A.

Probability: Example 5

- A pack of 52 playing cards has 26 red cards and 26 black cards.
- One card is drawn from the full pack at random, then *kept*.
- Then a second card is drawn from the pack.
- Calculate the probability that both cards are red.
- Let $A =$ 'The first card is red' and $B =$ 'The second card is red'.
- $P(A) = \frac{26}{52} = \frac{1}{2}$ as before but $P(B)$ is a conditional probability because it depends on the result of event A.
- If the first card was red, then there are now only 25 cards left in the remaining 51 cards, so:

$$P(B|A) = \frac{25}{51}.$$

Probability: Example 5

- A pack of 52 playing cards has 26 red cards and 26 black cards.
- One card is drawn from the full pack at random, then *kept*.
- Then a second card is drawn from the pack.
- Calculate the probability that both cards are red.
- Let $A =$ 'The first card is red' and $B =$ 'The second card is red'.
- $P(A) = \frac{26}{52} = \frac{1}{2}$ as before but $P(B)$ is a conditional probability because it depends on the result of event A.
- If the first card was red, then there are now only 25 cards left in the remaining 51 cards, so:

$$P(B|A) = \frac{25}{51}.$$

- This means the probability that the second card is red given the first card was red is:

$$P(A \wedge B) = P(B|A) \times P(A) = \frac{25}{51} \times \frac{1}{2} = \frac{25}{102}.$$

Conditional Probability

- The **conditional probability** can be expressed as

$$P(B|A) = \frac{P(A \wedge B)}{P(A)}.$$

Conditional Probability

- The **conditional probability** can be expressed as

$$P(B|A) = \frac{P(A \wedge B)}{P(A)}.$$

- This can be rearranged as

$$P(A \wedge B) = P(B|A) \times P(A).$$

Conditional Probability

- The **conditional probability** can be expressed as

$$P(B|A) = \frac{P(A \wedge B)}{P(A)}.$$

- This can be rearranged as

$$P(A \wedge B) = P(B|A) \times P(A).$$

- If A and B are independent, then

$$P(B|A) = P(B).$$

Probability: Example 6

- Calculate the probability that the first card is black and the second card is red.

Probability: Example 6

- Calculate the probability that the first card is black and the second card is red.
- Both cards are red:

$$P(A \wedge B) = P(B|A) \times P(A) = \frac{25}{51} \times \frac{1}{2} = \frac{25}{102}.$$

Probability: Example 6

- Calculate the probability that the first card is black and the second card is red.
- Both cards are red:

$$P(A \wedge B) = P(B|A) \times P(A) = \frac{25}{51} \times \frac{1}{2} = \frac{25}{102}.$$

- First card is black, second card is red:

$$P(\overline{A} \wedge B) = P(B|\overline{A}) \times P(\overline{A}) = \frac{26}{51} \times \frac{1}{2} = \frac{26}{102}.$$

Probability Trees

- For small examples, we can often visualise things in the form of a **probability tree**.

Probability Trees

- For small examples, we can often visualise things in the form of a **probability tree**.
